However, individual transcript sequences of the same gene can differ through naturally occurring variations (e.g. polymorphisms), each with its own valid existence. This clone is substantially in agreement with the reference, but a complete review of all prevailing variants is recommended prior to use. <u>More info</u>

Gene Summary:This gene encodes a protein with a coiled-coil motif and a RING-H2 motif (C3H2C2) at its
carboxy-terminus. The RING motif is a zinc-binding domain found in a large set of proteins
playing roles in diverse cellular processes including oncogenesis, development, signal
transduction, and apoptosis. Multiple transcript variants encoding different isoforms have
been found for this gene. [provided by RefSeq, Dec 2008]
