OTI Disclaimer:

Sequence:

The molecular sequence of this clone aligns with the gene accession number as a point of reference only. However, individual transcript sequences of the same gene can differ through naturally occurring variations (e.g. polymorphisms), each with its own valid existence. This clone is substantially in agreement with the reference, but a complete review of all prevailing

variants is recommended prior to use. More info

OTI Annotation: This clone was engineered to express the complete ORF with an expression tag. Expression

varies depending on the nature of the gene.

FECH (NM_001012515) Human Tagged ORF Clone Lentiviral Particle - RC215223L1V

MW: 48.63 kDa

Gene Summary: The protein encoded by this gene is localized to the mitochondrion, where it catalyzes the

insertion of the ferrous form of iron into protoporphyrin IX in the heme synthesis pathway. Mutations in this gene are associated with erythropoietic protoporphyria. Two transcript variants encoding different isoforms have been found for this gene. A pseudogene of this

gene is found on chromosome 3.[provided by RefSeq, May 2010]
