Gene Summary:This gene encodes a T cell adaptor protein, a class of intracellular molecules with modular<br/>domains capable of recruiting additional proteins but that exhibit no intrinsic enzymatic<br/>activity. The encoded protein contains a unique N-terminal region followed by a PH domain<br/>and C-terminal SH3 domain. Along with the adhesion and degranulation-promoting adaptor<br/>protein, the encoded protein plays a critical role in inside-out signaling by coupling T-cell<br/>antigen receptor stimulation to the activation of integrins.
