Gene Summary:This gene encodes a protein which contains an N-terminal sterile alpha motif (SAM) for<br/>protein-protein interactions, followed by an ATP/GTP-binding motif, a GTPase-activating<br/>protein (GAP) domain, and a C-terminal STAR-related lipid transfer (START) domain. It may be<br/>involved in regulation of cytoskeletal reorganization, cell proliferation, and cell motility, and<br/>acts as a tumor suppressor in hepatoma cells. The gene is located in a region of<br/>chromosome 13 that is associated with loss of heterozygosity in hepatocellular carcinomas.<br/>Alternatively spliced transcript variants encoding different isoforms have been described for<br/>this gene.
