Gene Summary:This gene is a member of the tachykinin family of neurotransmitter-encoding genes.
Tachykinin proteins are cleaved into small, secreted peptides that activate members of a
family of receptor proteins. The products of this gene preferentially activate tachykinin
receptor 1, and are thought to regulate peripheral endocrine and paracrine functions
including blood pressure, the immune system, and endocrine gland secretion. The products
of this gene lack a dibasic cleavage site found in other tachykinin proteins. Consequently, the
nature of the cleavage products generated in vivo remains to be determined. Multiple
transcript variants encoding different isoforms have been found for this gene. [provided by
RefSeq, Jul 2008]
