Gene Summary:Heterogeneous nuclear RNAs (hnRNAs) which include mRNA precursors and mature mRNAs
are associated with specific proteins to form heterogenous ribonucleoprotein (hnRNP)
complexes. Heterogeneous nuclear ribonucleoprotein L is among the proteins that are stably
associated with hnRNP complexes and along with other hnRNP proteins is likely to play a
major role in the formation, packaging, processing, and function of mRNA. Heterogeneous
nuclear ribonucleoprotein L is present in the nucleoplasm as part of the HNRP complex.
HNRP proteins have also been identified outside of the nucleoplasm. Exchange of hnRNP for
mRNA-binding proteins accompanies transport of mRNA from the nucleus to the cytoplasm.
Since HNRP proteins have been shown to shuttle between the nucleus and the cytoplasm, it is
possible that they also have cytoplasmic functions. Two transcript variants encoding different
isoforms have been found for this gene. [provided by RefSeq, Jul 2008]
