NRAMP1 (SLC11A1) (NM 000578) Human Tagged ORF Clone Lentiviral Particle

Product data:

Product Type: Lentiviral Particles

Product Name: NRAMP1 (SLC11A1) (NM_000578) Human Tagged ORF Clone Lentiviral Particle

Symbol: SLC11A1

Synonyms: LSH; NRAMP; NRAMP1

Mammalian Cell

Selection:

Puromycin

Vector: pLenti-C-mGFP-P2A-Puro (PS100093)

Tag: mGFP

ACCN: NM_000578 **ORF Size:** 1650 bp

ORF Nucleotide

OTI Disclaimer:

.

Sequence:

The ORF insert of this clone is exactly the same as(RC219733).

The molecular sequence of this clone aligns with the gene accession number as a point of reference only. However, individual transcript sequences of the same gene can differ through naturally occurring variations (e.g. polymorphisms), each with its own valid existence. This clone is substantially in agreement with the reference, but a complete review of all prevailing

variants is recommended prior to use. More info

OTI Annotation: This clone was engineered to express the complete ORF with an expression tag. Expression

varies depending on the nature of the gene.

RefSeg: NM 000578.2, NP 000569.2

 RefSeq Size:
 2573 bp

 RefSeq ORF:
 1653 bp

 Locus ID:
 6556

 UniProt ID:
 P49279

 Cytogenetics:
 2q35

Domains: Nramp

Protein Families: Transmembrane

Protein Pathways: Lysosome

MW: 59.7 kDa

Gene Summary: This gene is a member of the solute carrier family 11 (proton-coupled divalent metal ion

transporters) family and encodes a multi-pass membrane protein. The protein functions as a divalent transition metal (iron and manganese) transporter involved in iron metabolism and host resistance to certain pathogens. Mutations in this gene have been associated with susceptibility to infectious diseases such as tuberculosis and leprosy, and inflammatory diseases such as rheumatoid arthritis and Crohn disease. Alternatively spliced variants that encode different protein isoforms have been described but the full-length nature of only one

has been determined. [provided by RefSeq, Jul 2008]
