Parathyroid Hormone (PTH) (NM_000315) Human Tagged ORF Clone Lentiviral Particle

Product data:

Product Type: Lentiviral Particles

Product Name: Parathyroid Hormone (PTH) (NM_000315) Human Tagged ORF Clone Lentiviral Particle

Symbol: Parathyroid Hormone

Synonyms: FIH1; PTH1

Mammalian Cell

Selection:

None

Vector: pLenti-C-mGFP (PS100071)

Tag: mGFP

ACCN: NM_000315

ORF Size: 345 bp

ORF Nucleotide

The ORF insert of this clone is exactly the same as(RC219848).

OTI Disclaimer:

Sequence:

The molecular sequence of this clone aligns with the gene accession number as a point of reference only. However, individual transcript sequences of the same gene can differ through naturally occurring variations (e.g. polymorphisms), each with its own valid existence. This clone is substantially in agreement with the reference, but a complete review of all prevailing

variants is recommended prior to use. More info

OTI Annotation: This clone was engineered to express the complete ORF with an expression tag. Expression

varies depending on the nature of the gene.

RefSeg: NM 000315.2

RefSeq Size: 828 bp
RefSeq ORF: 348 bp
Locus ID: 5741
UniProt ID: P01270
Cytogenetics: 11p15.3

Protein Families: Druggable Genome, Secreted Protein

MW: 12.9 kDa

Parathyroid Hormone (PTH) (NM_000315) Human Tagged ORF Clone Lentiviral Particle – RC219848L2V

Gene Summary:

This gene encodes a member of the parathyroid family of proteins. The encoded preproprotein is proteolytically processed to generate a protein that binds to the parathyroid hormone/parathyroid hormone-related peptide receptor and regulates blood calcium and phosphate levels. Excess production of the encoded protein, known as hyperparathyroidism, can result in hypercalcemia and kidney stones. On the other hand, defective processing of the encoded protein may lead to hypoparathyroidism, which can result in hypocalcemia and numbness. Alternative splicing results in multiple transcript variants. [provided by RefSeq, Oct 2015]
