Gene Summary:The protein encoded by this gene is a member of the rhomboid family of integral membrane
proteins. This family contains proteins that are related to Drosophila rhomboid protein.
Members of this family are found in both prokaryotes and eukaryotes and are thought to
function as intramembrane serine proteases. The encoded protein is thought to release
soluble growth factors by proteolytic cleavage of certain membrane-bound substrates,
including ephrin B2 and ephrin B3. Two transcript variants encoding different isoforms have
been found for this gene. [provided by RefSeq, Feb 2015]
