Gene Summary:This gene encodes a protein containing a FERM (4.2, exrin, radixin, moesin) domain, a Dbl
homology domain, and two pleckstrin homology domains. These domains are found in
guanine nucleotide exchange factors and proteins that link the cytoskeleton to the cell
membrane. The encoded protein functions in neurons to promote dendritic growth.
Alternative splicing results in multiple transcript variants. [provided by RefSeq, Nov 2013]
