## Product datasheet for RC220864L3

## p73 (TP73) (NM_005427) Human Tagged Lenti ORF Clone

## Product data:

## Product Type: Expression Plasmids

Product Name: p73 (TP73) (NM_005427) Human Tagged Lenti ORF Clone

## Tag:

Symbol:
Myc-DDK
p73
Synonyms:
P73
Mammalian Cell
Selection:
Vector:
E. coli Selection:

ORF Nucleotide
Sequence:
Restriction Sites:
Cloning Scheme:
Sgfl-Mlul

Cloning sites used for ORF Shuttling:

ACCN:
ORF Size:

NM_005427
1908 bp

## OTI Disclaimer:

## OTI Annotation:

## Components:

Reconstitution Method: 1. Centrifuge at 5,000xg for 5 min

RefSeq:
RefSeq Size:
RefSeq ORF:
Locus ID:
UniProt ID:
Cytogenetics:
Protein Families:
Protein Pathways:
MW:
Gene Summary:
2. Carefully open the tube and add 100ul of sterile water to dissolve the DNA.
3. Close the tube and incubate for 10 minutes at room temperature.
4. Briefly vortex the tube and then do a quick spin (less than 5000xg) to concentrate the liquid at the bottom.
5. Store the suspended plasmid at $-20^{\circ} \mathrm{C}$. The DNA is stable for at least one year from date of shipping when stored at $-20^{\circ} \mathrm{C}$.
The molecular sequence of this clone aligns with the gene accession number as a point of reference only. However, individual transcript sequences of the same gene can differ through naturally occurring variations (e.g. polymorphisms), each with its own valid existence. This clone is substantially in agreement with the reference, but a complete review of all prevailing variants is recommended prior to use. More info

This clone was engineered to express the complete ORF with an expression tag. Expression varies depending on the nature of the gene.
The ORF clone is ion-exchange column purified and shipped in a 2D barcoded Matrix tube containing 10ug of transfection-ready, dried plasmid DNA (reconstitute with 100 ul of water).

Druggable Genome, Transcription Factors
Neurotrophin signaling pathway, p53 signaling pathway
69.4 kDa

This gene encodes a member of the p53 family of transcription factors involved in cellular responses to stress and development. It maps to a region on chromosome 1 p36 that is frequently deleted in neuroblastoma and other tumors, and thought to contain multiple tumor suppressor genes. The demonstration that this gene is monoallelically expressed (likely from the maternal allele), supports the notion that it is a candidate gene for neuroblastoma. Many transcript variants resulting from alternative splicing and/or use of alternate promoters have been found for this gene, but the biological validity and the fulllength nature of some variants have not been determined. [provided by RefSeq, Feb 2011]
