Gene Summary:This gene encodes a mitochondrial acyl-coenzyme A synthetase that is specific for medium
chain fatty acids. These enzymes catalyze fatty acid activation, the first step of fatty acid
metabolism, through the transfer of acyl-CoA. These enzymes also participate in the glycine
conjugation pathway in the detoxification of xenobiotics such as benzoate and ibuprofen.
Expression levels of this gene in the kidney may be correlated with kidney function. This gene
and its paralog ACSM2B (Gene ID: 348158), both present on chromosome 16, likely arose
from a chromosomal duplication event. [provided by RefSeq, May 2017]
