| OTI Disclaimer:              | The molecular sequence of this clone aligns with the gene accession number as a point of reference only. However, individual transcript sequences of the same gene can differ through naturally occurring variations (e.g. polymorphisms), each with its own valid existence. This clone is substantially in agreement with the reference, but a complete review of all prevailing variants is recommended prior to use. <u>More info</u> |
| OTI Annotation:              | This clone was engineered to express the complete ORF with an expression tag. Expression varies depending on the nature of the gene.  |

| MW:           | 17.7 kDa   |
| Gene Summary: | Globin gene expression is regulated through nuclear factor erythroid-2 (NFE2) elements<br>located in enhancer-like locus control regions positioned many kb upstream of alpha- and<br>beta-gene clusters (summarized by Blank et al., 1997 [PubMed 9166829]). NFE2 DNA-binding<br>activity consists of a heterodimer containing a ubiquitous small Maf protein (MafF, MIM<br>604877; MafG; or MafK, MIM 600197) and the tissue-restricted protein p45 NFE2 (MIM<br>601490). Both subunits are members of the activator protein-1-like superfamily of basic<br>leucine zipper (bZIP) proteins (see MIM 165160).[supplied by OMIM, Mar 2010] |
