ID1 (NM_181353) Human Tagged Lenti ORF Clone - RC222579L2

OTI Disclaimer: The molecular sequence of this clone aligns with the gene accession number as a point of

reference only. However, individual transcript sequences of the same gene can differ through naturally occurring variations (e.g. polymorphisms), each with its own valid existence. This clone is substantially in agreement with the reference, but a complete review of all prevailing

variants is recommended prior to use. More info

OTI Annotation: This clone was engineered to express the complete ORF with an expression tag. Expression

varies depending on the nature of the gene.

Components: The ORF clone is ion-exchange column purified and shipped in a 2D barcoded Matrix tube

containing 10ug of transfection-ready, dried plasmid DNA (reconstitute with 100 ul of water).

Reconstitution Method: 1. Centrifuge at 5,000xg for 5min.

2. Carefully open the tube and add 100ul of sterile water to dissolve the DNA.

3. Close the tube and incubate for 10 minutes at room temperature.

4. Briefly vortex the tube and then do a quick spin (less than 5000xg) to concentrate the liquid

at the bottom.

5. Store the suspended plasmid at -20°C. The DNA is stable for at least one year from date of

shipping when stored at -20°C.

 UniProt ID:
 P41134

Cytogenetics: 20q11.21

Protein Families: Druggable Genome, Transcription Factors

Protein Pathways: TGF-beta signaling pathway

MW: 15.4 kDa

Gene Summary: The protein encoded by this gene is a helix-loop-helix (HLH) protein that can form

heterodimers with members of the basic HLH family of transcription factors. The encoded

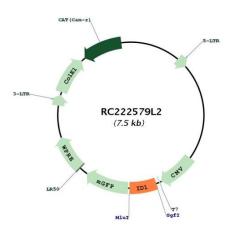

protein has no DNA binding activity and therefore can inhibit the DNA binding and

transcriptional activation ability of basic HLH proteins with which it interacts. This protein may play a role in cell growth, senescence, and differentiation. Two transcript variants encoding

different isoforms have been found for this gene. [provided by RefSeq, Jul 2008]
