

# Product datasheet for RC222871L3

# PTPRU (NM\_133178) Human Tagged Lenti ORF Clone

# **Product data:**

### **Product Type: Expression Plasmids Product Name:** PTPRU (NM\_133178) Human Tagged Lenti ORF Clone Tag: Myc-DDK PTPRU Symbol: FMI; hPTP-J; PCP-2; PTP; PTP-J; PTP-PI; PTP-RO; PTPPSI; PTPRO; PTPU2; R-PTP-PSI; R-PTP-U Synonyms: Mammalian Cell Puromycin Selection: Vector: pLenti-C-Myc-DDK-P2A-Puro (PS100092) E. coli Selection: Chloramphenicol (34 ug/mL) The ORF insert of this clone is exactly the same as(RC222871). **ORF** Nucleotide Sequence: **Restriction Sites:** Sgfl-Rsrll **Cloning Scheme:** Cloning sites used for ORF Shuttling: ORF Sqf I Rsr II --- GCG ATC GCC ATG --- //--- NNN AGC GGA CCG --

\* The last codon before the Stop codon of the ORF.

ACCN: ORF Size: NM\_133178 4308 bp

| OTI Disclaimer:     | Due to the inherent nature of this plasmid, standard methods to replicate additional amounts<br>of DNA in E. coli are highly likely to result in mutations and/or rearrangements. Therefore,<br>OriGene does not guarantee the capability to replicate this plasmid DNA. Additional amounts<br>of DNA can be purchased from OriGene with batch-specific, full-sequence verification at a<br>reduced cost. Please contact our customer care team at <u>custsupport@origene.com</u> or by<br>calling 301.340.3188 option 3 for pricing and delivery. |
|                     | The molecular sequence of this clone aligns with the gene accession number as a point of reference only. However, individual transcript sequences of the same gene can differ through naturally occurring variations (e.g. polymorphisms), each with its own valid existence. This clone is substantially in agreement with the reference, but a complete review of all prevailing variants is recommended prior to use. <u>More info</u>                                                                                                          |
| OTI Annotation:     | This clone was engineered to express the complete ORF with an expression tag. Expression varies depending on the nature of the gene.                                                                                                                                                                                                                                                                                                                                                                                                               |
| Components:         | The ORF clone is ion-exchange column purified and shipped in a 2D barcoded Matrix tube containing 10ug of transfection-ready, dried plasmid DNA (reconstitute with 100 ul of water).                                                                                                                                                                                                                                                                                                                                                               |
| Reconstitution Meth | <ul> <li>centrifuge at 5,000xg for 5min.</li> <li>Carefully open the tube and add 100ul of sterile water to dissolve the DNA.</li> <li>Close the tube and incubate for 10 minutes at room temperature.</li> <li>Briefly vortex the tube and then do a quick spin (less than 5000xg) to concentrate the liquid at the bottom.</li> <li>Store the suspended plasmid at -20°C. The DNA is stable for at least one year from date of shipping when stored at -20°C.</li> </ul>                                                                         |
| RefSeq:             | <u>NM 133178.3</u>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| RefSeq Size:        | 5602 bp                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| RefSeq ORF:         | 4311 bp                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

### PTPRU (NM\_133178) Human Tagged Lenti ORF Clone – RC222871L3

# Gene Summary:The protein encoded by this gene is a member of the protein tyrosine phosphatase (PTP)<br/>family. PTPs are known to be signaling molecules that regulate a variety of cellular processes<br/>including cell growth, differentiation, mitotic cycle, and oncogenic transformation. This PTP<br/>possesses an extracellular region, a single transmembrane region, and two tandem<br/>intracellular catalytic domains, and thus represents a receptor-type PTP. The extracellular<br/>region contains a meprin-A5 antigen-PTP (MAM) domain, Ig-like and fibronectin type III-like<br/>repeats. This PTP was thought to play roles in cell-cell recognition and adhesion. Studies of<br/>the similar gene in mice suggested the role of this PTP in early neural development. The<br/>expression of this gene was reported to be regulated by phorbol myristate acetate (PMA) or<br/>calcium ionophore in Jurkat T lymphoma cells. Alternatively spliced transcript variants have<br/>been reported. [provided by RefSeq, Aug 2010]
