Gene Summary:This locus represents naturally occurring readthrough transcription between the neighboring
MYZAP (myocardial zonula adherens protein) and POLR2M (polymerase (RNA) II (DNA
directed) polypeptide M) genes on chromosome 15. Alternative splicing results in multiple
readthrough transcript variants. Readthrough variants may encode proteins that share
sequence identity with the upstream gene product or with both the upstream and
downstream gene products. Some readthrough transcript variants are also expected to be
candidates for nonsense-mediated decay (NMD). [provided by RefSeq, Oct 2013]
