Gene Summary:This gene encodes a C2H2 type zinc-finger protein by its similarity to the mouse Bcl11a/Evi9
protein. The corresponding mouse gene is a common site of retroviral integration in myeloid
leukemia, and may function as a leukemia disease gene, in part, through its interaction with
BCL6. During hematopoietic cell differentiation, this gene is down-regulated. It is possibly
involved in lymphoma pathogenesis since translocations associated with B-cell malignancies
also deregulates its expression. Multiple transcript variants encoding several different
isoforms have been found for this gene. [provided by RefSeq, Jul 2008]
