OTI Disclaimer: The molecular sequence of this clone aligns with the gene accession number as a point of reference only. However, individual transcript sequences of the same gene can differ through

naturally occurring variations (e.g. polymorphisms), each with its own valid existence. This clone is substantially in agreement with the reference, but a complete review of all prevailing

variants is recommended prior to use. More info

OTI Annotation: This clone was engineered to express the complete ORF with an expression tag. Expression

varies depending on the nature of the gene.

Protein Pathways: Wnt signaling pathway

MW: 94.1 kDa

Gene Summary: This gene encodes a nuclear receptor that may be a negative regulator of the Wnt/beta-

catenin signaling pathway. The encoded protein localizes to the nuclear membrane and has been implicated in the nuclear trafficking of the transcription repressors REST/NRSF and REST4. Mutations in this gene have been linked to progressive myoclonus epilepsy. Alternate

splicing results in multiple transcript variants. A pseudogene of this gene is found on

chromosome 3. [provided by RefSeq, Sep 2009]
