BAI1 (ADGRB1) (NM_001702) Human Tagged Lenti ORF Clone

Product data:

Product Type: Expression Plasmids

Product Name: BAI1 (ADGRB1) (NM 001702) Human Tagged Lenti ORF Clone

Tag: Myc-DDK

Symbol: BAI1

Synonyms: BAI1; GDAIF

Mammalian Cell Puromycin

Selection:

Vector: pLenti-C-Myc-DDK-P2A-Puro (PS100092)

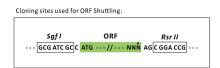

E. coli Selection: Chloramphenicol (34 ug/mL)

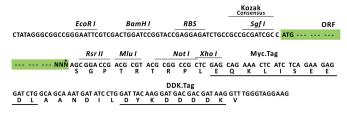

ORF Nucleotide The ORF insert of this clone is exactly the same as(RC224196).

Sequence:

Restriction Sites: Sgfl-Rsrll

Cloning Scheme:

st The last codon before the Stop codon of the ORF.

ACCN: NM_001702

ORF Size: 4752 bp

BAI1 (ADGRB1) (NM_001702) Human Tagged Lenti ORF Clone - RC224196L3

OTI Disclaimer: The molecular sequence of this clone aligns with the gene accession number as a point of

reference only. However, individual transcript sequences of the same gene can differ through naturally occurring variations (e.g. polymorphisms), each with its own valid existence. This clone is substantially in agreement with the reference, but a complete review of all prevailing

variants is recommended prior to use. More info

OTI Annotation: This clone was engineered to express the complete ORF with an expression tag. Expression

varies depending on the nature of the gene.

Components: The ORF clone is ion-exchange column purified and shipped in a 2D barcoded Matrix tube

containing 10ug of transfection-ready, dried plasmid DNA (reconstitute with 100 ul of water).

Reconstitution Method: 1. Centrifuge at 5,000xg for 5min.

2. Carefully open the tube and add 100ul of sterile water to dissolve the DNA.

3. Close the tube and incubate for 10 minutes at room temperature.

4. Briefly vortex the tube and then do a quick spin (less than 5000xg) to concentrate the liquid

at the bottom.

5. Store the suspended plasmid at -20°C. The DNA is stable for at least one year from date of

shipping when stored at -20°C.

RefSeq: <u>NM 001702.1</u>

RefSeq Size:5535 bpRefSeq ORF:4755 bp

Locus ID: 575

UniProt ID: <u>O14514</u>
Cytogenetics: 8q24.3

Protein Families: Druggable Genome, Transmembrane

Protein Pathways: p53 signaling pathway

MW: 173.5 kDa

Gene Summary: Angiogenesis is controlled by a local balance between stimulators and inhibitors of new

vessel growth and is suppressed under normal physiologic conditions. Angiogenesis has been shown to be essential for growth and metastasis of solid tumors. In order to obtain blood supply for their growth, tumor cells are potently angiogenic and attract new vessels as results of increased secretion of inducers and decreased production of endogenous negative

regulators. BAI1 contains at least one 'functional' p53-binding site within an intron, and its expression has been shown to be induced by wildtype p53. There are two other brain-specific angiogenesis inhibitor genes, designated BAI2 and BAI3 which along with BAI1 have similar tissue specificities and structures, however only BAI1 is transcriptionally regulated by p53.

BAI1 is postulated to be a member of the secretin receptor family, an inhibitor of angiogenesis and a growth suppressor of glioblastomas [provided by RefSeq, Jul 2008]
