Gene Summary:The protein encoded by this gene is a natural cytotoxicity receptor (NCR) that may aid NK
cells in the lysis of tumor cells. The encoded protein interacts with CD3-zeta (CD247), a T-cell
receptor. A single nucleotide polymorphism in the 5' untranslated region of this gene has
been associated with mild malaria suceptibility. Three transcript variants encoding different
isoforms have been found for this gene.[provided by RefSeq, May 2010]
