Gene Summary:Kallikreins are a subgroup of serine proteases having diverse physiological functions. Growing
evidence suggests that many kallikreins are implicated in carcinogenesis and some have
potential as novel cancer and other disease biomarkers. This gene is one of the fifteen
kallikrein subfamily members located in a cluster on chromosome 19. Alternate splicing and
the use of alternate promoters results in multiple transcript variants encoding distinct
isoforms which are differentially expressed. [provided by RefSeq, Dec 2016]
