Gene Summary:This gene encodes a member of the syntaxin superfamily. Syntaxins are nervous system-<br/>specific proteins implicated in the docking of synaptic vesicles with the presynaptic plasma<br/>membrane. Syntaxins possess a single C-terminal transmembrane domain, a SNARE [Soluble<br/>NSF (N-ethylmaleimide-sensitive fusion protein)-Attachment protein REceptor] domain<br/>(known as H3), and an N-terminal regulatory domain (Habc). Syntaxins bind synaptotagmin in<br/>a calcium-dependent fashion and interact with voltage dependent calcium and potassium<br/>channels via the C-terminal H3 domain. This gene product is a key molecule in ion channel<br/>regulation and synaptic exocytosis. Alternatively spliced transcript variants encoding different<br/>isoforms have been found for this gene.[provided by RefSeq, Sep 2009]
