Gene Summary:Staufen homolog 2 is a member of the family of double-stranded RNA (dsRNA)-binding
proteins involved in the transport and/or localization of mRNAs to different subcellular
compartments and/or organelles. These proteins are characterized by the presence of
multiple dsRNA-binding domains which are required to bind RNAs having double-stranded
secondary structures. Staufen homolog 2 shares 48.5% and 59.9% similarity with drosophila
and human staufen, respectively. The exact function of Staufen homolog 2 is not known, but
since it contains 3 copies of conserved dsRNA binding domain, it could be involved in double-
stranded RNA binding events. Several transcript variants encoding different isoforms have
been found for this gene. [provided by RefSeq, Aug 2009]
