Gene Summary:Keratins are intermediate filament proteins responsible for the structural integrity of<br/>epithelial cells. The type II keratins consist of basic or neutral proteins which are arranged in<br/>pairs of heterotypic keratin chains coexpressed during differentiation of simple and stratified<br/>epithelial tissues. This gene encodes a type II keratin that is specifically expressed in the inner<br/>root sheath of hair follicles. The type II keratins are clustered in a region of chromosome<br/>12q12-q13. Multiple transcript variants encoding different isoforms have been found for this<br/>gene.[provided by RefSeq, Jun 2009]
