Gene Summary:This gene encodes a low density lipoprotein receptor that belongs to the C-type lectin
superfamily. This gene is regulated through the cyclic AMP signaling pathway. The encoded
protein binds, internalizes and degrades oxidized low-density lipoprotein. This protein may
be involved in the regulation of Fas-induced apoptosis. This protein may play a role as a
scavenger receptor. Mutations of this gene have been associated with atherosclerosis, risk of
myocardial infarction, and may modify the risk of Alzheimer's disease. Alternate splicing
results in multiple transcript variants.[provided by RefSeq, Feb 2010]
