Gene Summary:The protein encoded by this gene contains a RING finger motif and acts as a transcription
regulator. This protein has been shown to interact with, and inhibit the activity of, TRPS1, a
transcription suppressor of GATA-mediated transcription. Transcription repressor
ZNF278/PATZ is found to interact with this protein, and thus reduce the enhancement of
androgen receptor-dependent transcription mediated by this protein. Studies of the mouse
and rat counterparts suggested a role of this protein in spermatogenesis. A pseudogene of
this gene is found on chromosome 1.[provided by RefSeq, Jul 2010]
