Gene Summary:The protein encoded by this gene belongs to the caspase recruitment domain (CARD)-
containing family of proteins, which are involved in pathways leading to activation of
caspases or nuclear factor kappa-B (NFKB). This protein may be a component of the
inflammasome, a protein complex that plays a role in the activation of proinflammatory
caspases. It is thought that this protein acts as an adaptor molecule that negatively regulates
NFKB activation, CASP1-dependent IL1B secretion, and apoptosis. Polymorphisms in this gene
may be associated with a susceptibility to rheumatoid arthritis. Alternatively spliced
transcript variants have been described for this gene. [provided by RefSeq, May 2010]
