Gene Summary:This gene encodes a member of the serine protease family. Serine proteases are known to be
involved in a variety of biological processes, whose malfunction often leads to human
diseases and disorders. This gene was identified as a gene overexpressed in pancreatic
carcinoma. The encoded protein is membrane bound with a N-terminal anchor sequence and
a glycosylated extracellular region containing the serine protease domain. Multiple transcript
variants encoding different isoforms have been found for this gene. [provided by RefSeq, Jul
