| <b>ORIGENE</b> DGCR2   | (NM_001173533) Human Tagged Lenti ORF Clone – RC230205L3   |
|------------------------|--|
| OTI Disclaimer:        | The molecular sequence of this clone aligns with the gene accession number as a point of reference only. However, individual transcript sequences of the same gene can differ through naturally occurring variations (e.g. polymorphisms), each with its own valid existence. This clone is substantially in agreement with the reference, but a complete review of all prevailing variants is recommended prior to use. <u>More info</u>  |
| OTI Annotation:        | This clone was engineered to express the complete ORF with an expression tag. Expression varies depending on the nature of the gene.   |
| Components:            | The ORF clone is ion-exchange column purified and shipped in a 2D barcoded Matrix tube containing 10ug of transfection-ready, dried plasmid DNA (reconstitute with 100 ul of water).   |
| Reconstitution Method: | <ol> <li>Centrifuge at 5,000xg for 5min.</li> <li>Carefully open the tube and add 100ul of sterile water to dissolve the DNA.</li> <li>Close the tube and incubate for 10 minutes at room temperature.</li> <li>Briefly vortex the tube and then do a quick spin (less than 5000xg) to concentrate the liquid at the bottom.</li> <li>Store the suspended plasmid at -20°C. The DNA is stable for at least one year from date of shipping when stored at -20°C.</li> </ol>   |

| RefSeq ORF:            | 1530 bp  |
| Locus ID:              | 9993   |
| UniProt ID:            | <u>P98153</u>  |
| Cytogenetics:          | 22q11.21   |
| Protein Families:      | Druggable Genome, Transmembrane  |
| MW:                    | 56.7 kDa   |
| Gene Summary:          | Deletions of the 22q11.2 have been associated with a wide range of developmental defects<br>(notably DiGeorge syndrome, velocardiofacial syndrome, conotruncal anomaly face<br>syndrome and isolated conotruncal cardiac defects) classified under the acronym CATCH 22.<br>The DGCR2 gene encodes a novel putative adhesion receptor protein, which could play a role<br>in neural crest cells migration, a process which has been proposed to be altered in DiGeorge<br>syndrome. Alternative splicing results in multiple transcript variants.[provided by RefSeq, May<br>2010] |
