Gene Summary:Nucleoside diphosphate kinase (NDK) exists as a hexamer composed of 'A' (encoded by
NME1) and 'B' (encoded by this gene) isoforms. Multiple alternatively spliced transcript
variants have been found for this gene. Read-through transcription from the neighboring
upstream gene (NME1) generates naturally-occurring transcripts (NME1-NME2) that encode a
fusion protein comprised of sequence sharing identity with each individual gene product.
