GPR33 (NM_001197184) Human Tagged Lenti ORF Clone | RC231167L4

OTI Disclaimer: The molecular sequence of this clone aligns with the gene accession number as a point of

reference only. However, individual transcript sequences of the same gene can differ through naturally occurring variations (e.g. polymorphisms), each with its own valid existence. This clone is substantially in agreement with the reference, but a complete review of all prevailing

variants is recommended prior to use. More info

OTI Annotation: This clone was engineered to express the complete ORF with an expression tag. Expression

varies depending on the nature of the gene.

Components: The ORF clone is ion-exchange column purified and shipped in a 2D barcoded Matrix tube

containing 10ug of transfection-ready, dried plasmid DNA (reconstitute with 100 ul of water).

Reconstitution Method: 1. Centrifuge at 5,000xg for 5min.

2. Carefully open the tube and add 100ul of sterile water to dissolve the DNA.

3. Close the tube and incubate for 10 minutes at room temperature.

4. Briefly vortex the tube and then do a quick spin (less than 5000xg) to concentrate the liquid

at the bottom.

5. Store the suspended plasmid at -20°C. The DNA is stable for at least one year from date of

shipping when stored at -20°C.

Note: Plasmids are not sterile. For experiments where strict sterility is required, filtration with 0.22um

filter is required.

RefSeq: <u>NM_001197184.2</u>

RefSeq ORF: 1002 bp

Locus ID: 2856

UniProt ID: Q49SQ1

Cytogenetics: 14q12

MW: 38.7 kDa

Gene Summary: This gene has been identified as an orphan chemoattractant G-protein-coupled receptors

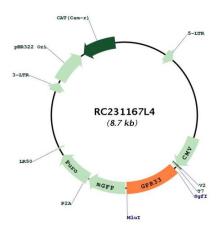

(GPCR) pseudogene. Studies have shown that the inactivated gene is present as the

predominant allele in the human population. A small fraction of the human population has

been found to harbor an intact allele. provided by RefSeq, Oct 2010
