Gene Summary:The outer dense fibers are cytoskeletal structures that surround the axoneme in the middle<br/>piece and principal piece of the sperm tail. The fibers function in maintaining the elastic<br/>structure and recoil of the sperm tail as well as in protecting the tail from shear forces during<br/>epididymal transport and ejaculation. Defects in the outer dense fibers lead to abnormal<br/>sperm morphology and infertility. This gene encodes one of the major outer dense fiber<br/>proteins. Alternative splicing results in multiple transcript variants. The longer transcripts,<br/>also known as 'Cenexins', encode proteins with a C-terminal extension that are differentially<br/>targeted to somatic centrioles and thought to be crucial for the formation of microtubule<br/>organizing centers.
