| OTI Disclaimer:              | Our molecular clone sequence data has been matched to the sequence identifier above as a point of reference. Note that the complete sequence of this clone is largely the same as the reference sequence but may contain minor differences , e.g., single nucleotide polymorphisms (SNPs).   |
| Components:                  | The cDNA clone is shipped in a 2-D bar-coded Matrix tube as 10 ug dried plasmid DNA. The package also includes 100 pmols of both the corresponding 5' and 3' vector primers in separate vials.   |

| Summary:  | Mammalian mitochondrial ribosomal proteins are encoded by nuclear genes and help in<br>protein synthesis within the mitochondrion. Mitochondrial ribosomes (mitoribosomes)<br>consist of a small 28S subunit and a large 39S subunit. They have an estimated 75% protein<br>to rRNA composition compared to prokaryotic ribosomes, where this ratio is reversed.<br>Another difference between mammalian mitoribosomes and prokaryotic ribosomes is that<br>the latter contain a 5S rRNA. Among different species, the proteins comprising the<br>mitoribosome differ greatly in sequence, and sometimes in biochemical properties, which<br>prevents easy recognition by sequence homology. This gene encodes a 39S subunit protein.<br>Sequence analysis identified alternatively spliced variants that encode different protein<br>isoforms. [provided by RefSeq, Jul 2008] |
