## MTH1 (NUDT1) (NM 198954) Human Untagged Clone

**Product data:** 

**Product Type:** Expression Plasmids

Product Name: MTH1 (NUDT1) (NM\_198954) Human Untagged Clone

Tag: Tag Free
Symbol: NUDT1
Synonyms: MTH1

Mammalian Cell

Selection:

Neomycin

Vector:pCMV6-Entry (PS100001)E. coli Selection:Kanamycin (25 ug/mL)

Fully Sequenced ORF: >SC307829 representing NM\_198954.

**Restriction Sites:** Sgfl-Mlul

Plasmid Map:

**ACCN:** NM 198954

**Insert Size:** 540 bp

**OTI Disclaimer:** Our molecular clone sequence data has been matched to the reference identifier above as a

point of reference. Note that the complete sequence of our molecular clones may differ from the sequence published for this corresponding reference, e.g., by representing an alternative

RNA splicing form or single nucleotide polymorphism (SNP).

## MTH1 (NUDT1) (NM\_198954) Human Untagged Clone - SC307829

OTI Annotation: This TrueClone is provided through our Custom Cloning Process that includes sub-cloning

into OriGene's pCMV6 vector and full sequencing to provide a non-variant match to the expected reference without frameshifts, and is delivered as lyophilized plasmid DNA.

**Components:** The ORF clone is ion-exchange column purified and shipped in a 2D barcoded Matrix tube

containing 10ug of transfection-ready, dried plasmid DNA (reconstitute with 100 ul of water).

**Reconstitution Method:** 1. Centrifuge at 5,000xg for 5min.

2. Carefully open the tube and add 100ul of sterile water to dissolve the DNA.

3. Close the tube and incubate for 10 minutes at room temperature.

4. Briefly vortex the tube and then do a quick spin (less than 5000xg) to concentrate the liquid

at the bottom.

5. Store the suspended plasmid at -20°C. The DNA is stable for at least one year from date of

shipping when stored at -20°C.

RefSeq: <u>NM 198954.1</u>

 RefSeq Size:
 801 bp

 RefSeq ORF:
 540 bp

 Locus ID:
 4521

 UniProt ID:
 P36639

 Cytogenetics:
 7p22.3

**Protein Families:** Stem cell - Pluripotency

MW: 20.3 kDa

**Gene Summary:** Misincorporation of oxidized nucleoside triphosphates into DNA/RNA during replication and

The protein encoded by this gene is an enzyme that hydrolyzes oxidized purine nucleoside triphosphates, such as 8-oxo-dGTP, 8-oxo-dATP, 2-hydroxy-dATP, and 2-hydroxy rATP, to monophosphates, thereby preventing misincorporation. The encoded protein is localized mainly in the cytoplasm, with some in the mitochondria, suggesting that it is involved in the sanitization of nucleotide pools both for nuclear and mitochondrial genomes. Several alternatively spliced transcript variants, some of which encode distinct isoforms, have been identified. Additional variants have been observed, but their full-length natures have not been determined. A rare single-nucleotide polymorphism that results in the production of an additional, longer isoform (p26) has been described. [provided by RefSeq, Dec 2018]

transcription can cause mutations that may result in carcinogenesis or neurodegeneration.

variant 1, resulting in translation initiation at an upstream ATG and an isoform (p22, also known as MTH1b) with a longer N-terminus compared to isoform p18. Variants 2B, 3B, and 4B

Transcript Variant: This variant (4B) differs in the 5' UTR and 5' coding region compared to

encode the same isoform.
