FMO5 (NM_001144830) Human Untagged Clone

Product data:

Product Type: Expression Plasmids

Product Name: FMO5 (NM_001144830) Human Untagged Clone

Tag:Tag FreeSymbol:FMO5Synonyms:hBVMO1

Vector: pCMV6 series

Fully Sequenced ORF: >NCBI ORF sequence for NM_001144830, the custom clone sequence may differ by one or

more nucleotides

ATTGCCCTCACAGAG

Restriction Sites: Please inquire **ACCN:** NM 001144830

OTI Disclaimer: Our molecular clone sequence data has been matched to the reference identifier above as a

point of reference. Note that the complete sequence of our molecular clones may differ from the sequence published for this corresponding reference, e.g., by representing an alternative

RNA splicing form or single nucleotide polymorphism (SNP).

OTI Annotation: This TrueClone is provided through our Custom Cloning Process that includes sub-cloning

into OriGene's pCMV6 vector and full sequencing to provide a non-variant match to the expected reference without frameshifts, and is delivered as lyophilized plasmid DNA.

FMO5 (NM_001144830) Human Untagged Clone - SC324881

Components: The ORF clone is ion-exchange column purified and shipped in a 2D barcoded Matrix tube

containing 10ug of transfection-ready, dried plasmid DNA (reconstitute with 100 ul of water).

Reconstitution Method: 1. Centrifuge at 5,000xg for 5min.

2. Carefully open the tube and add 100ul of sterile water to dissolve the DNA.

3. Close the tube and incubate for 10 minutes at room temperature.

4. Briefly vortex the tube and then do a quick spin (less than 5000xg) to concentrate the liquid

at the bottom.

5. Store the suspended plasmid at -20°C. The DNA is stable for at least one year from date of

shipping when stored at -20°C.

RefSeq: NM 001144830.1, NP 001138302.1

 RefSeq Size:
 2499 bp

 RefSeq ORF:
 858 bp

 Locus ID:
 2330

 UniProt ID:
 P49326

 Cytogenetics:
 1q21.1

Protein Families: Druggable Genome, Transmembrane
Protein Pathways: Drug metabolism - cytochrome P450

Gene Summary: Metabolic N-oxidation of the diet-derived amino-trimethylamine (TMA) is mediated by flavin-

containing monooxygenase and is subject to an inherited FMO3 polymorphism in man resulting in a small subpopulation with reduced TMA N-oxidation capacity resulting in fish odor syndrome Trimethylaminuria. Three forms of the enzyme, FMO1 found in fetal liver, FMO2 found in adult liver, and FMO3 are encoded by genes clustered in the 1q23-q25 region. Flavin-containing monooxygenases are NADPH-dependent flavoenzymes that catalyzes the oxidation of soft nucleophilic heteroatom centers in drugs, pesticides, and xenobiotics. Alternative splicing results in multiple transcript variants. [provided by RefSeq, Jan 2009] Transcript Variant: This variant (3) differs in the 5' UTR and lacks an alternate exon in the 3' coding region, compared to variant 1. This results in a frameshift and shorter protein (isoform

3), compared to isoform 1.
