some lymphocytes.
CD31, also known as platelet endothelial cell adhesion molecule 1 (PECAM1), is a type I
integral membrane glycoprotein and a member of the immunoglobulin superfamily of cell
surface receptors. It is constitutively expressed on the surface of endothelial cells, and
concentrated at the junction between them. It is also weakly expressed on many peripheral
lymphoid cells and platelets. CD31 has been used to measure angiogenesis in association
with tumor recurrence. Other studies have also indicated that CD31 and CD34 can be used as
markers for myeloid progenitor cells and recognize different subsets of myeloid leukemia
infiltrates (granular sarcomas).
