

Product datasheet for **SM3128P**

Vimentin (VIM) Mouse Monoclonal Antibody [Clone ID: VI-01]

Product data:

Product Type:	Primary Antibodies
Clone Name:	VI-01
Applications:	FC, IF, WB
Recommended Dilution:	Western blot: 1-2 µg/ml. Immunocytochemistry: <i>Staining technique:</i> RBL Rat basophilic leukemia cell line: (a) Fix cells for 10 min in methanol at -20°C and for 6 min in acetone at -20°C; (b) Fix cells directly in methanol for 10 min at -20°C or in acetone for 10 min at -20°C. <i>Incubation Time:</i> 45 min RT <i>Positive Control:</i> 3T3 Mouse Swiss albino fibroblast cell line RBL, Rat basophilic leukemia cell line.
Reactivity:	All Species
Host:	Mouse
Isotype:	IgM
Clonality:	Monoclonal
Immunogen:	Pellet of pig brain cold stable proteins after depolymerization of microtubules
Specificity:	The antibody reacts with Vimentin, a 57 kDa intermediate filament expressed in variety of mesenchymal and mesodermal cell types in all species (recognized epitope conserved within all species). Cross-reactivity was found with smooth muscle Desmin.
Formulation:	PBS , pH~7.4 State: Purified State: Liquid purified Ig fraction (> 95% by SDS-PAGE) Preservative: 15 mM Sodium Azide
Concentration:	lot specific
Purification:	Precipitation Methods
Conjugation:	Unconjugated
Storage:	Store the antibody undiluted at 2 - 8°C. DO NOT FREEZE!

[View online »](#)

Stability:	Shelf life: one year from despatch.
Gene Name:	vimentin
Database Link:	P08670
Background:	<p>Vimentin (57 kDa) is the most ubiquitous intermediate filament protein and the first to be expressed during cell differentiation. All primitive cell types express vimentin but in most non-mesenchymal cells it is replaced by other intermediate filament proteins during differentiation. Vimentin is expressed in a wide variety of mesenchymal cell types - fibroblasts, endothelial cells etc., and in a number of other cell types derived from mesoderm, e.g., mesothelium and ovarian granulosa cells. In non-vascular smooth muscle cells and striated muscle, vimentin is often replaced by desmin, however, during regeneration, vimentin is reexpressed. Cells of the lympho-haemopoietic system (lymphocytes, macrophages etc.) also express vimentin, sometimes in scarce amounts.</p> <p>Vimentin is also found in mesoderm derived epithelia, e.g. kidney (Bowman capsule), endometrium and ovary (surface epithelium), in myoepithelial cells (breast, salivary and sweat glands), and in thyroid gland epithelium. In these cell types, as in mesothelial cells, vimentin is coexpressed with cytokeratin.</p> <p>Furthermore, vimentin is detected in many cells from the neural crest. Particularly melanocytes express abundant vimentin. In glial cells vimentin is coexpressed with Glial Fibrillary Acidic Protein (GFAP).</p> <p>Vimentin is present in many different neoplasms but is particularly expressed in those originated from mesenchymal cells. Sarcomas e.g., fibrosarcoma, malignant fibrous histiocytoma, angiosarcoma, and leiomyosarcoma, as well as lymphomas, malignant melanoma and schwannoma, are virtually always vimentin positive. Mesoderm derived carcinomas like renal cell carcinoma, adrenal cortical carcinoma and adenocarcinomas from endometrium and ovary usually express vimentin. Also thyroid carcinomas are vimentin positive. Any low differentiated carcinoma may express some vimentin.</p> <p>Vimentin is frequently included in the so-called primary panel (together with CD45, cytokeratin, and S-100 protein). Intense staining reaction for vimentin without coexpression of other intermediate filament proteins is strongly suggestive of a mesenchymal tumour or malignant melanoma.</p>
Synonyms:	VIM
