| Summary:            | Many proteins are tethered to the extracellular face of eukaryotic plasma membranes by a<br>glycosylphosphatidylinositol (GPI) anchor. The GPI-anchor is a glycolipid found on many blood<br>cells. The protein encoded by this gene is a GPI degrading enzyme.<br>Glycosylphosphatidylinositol specific phospholipase D1 hydrolyzes the inositol phosphate<br>linkage in proteins anchored by phosphatidylinositol glycans, thereby releasing the attached<br>protein from the plasma membrane. | Performance<br>Guaranteed: | OriGene guarantees that at least two of the three Dicer-Substrate duplexes in the kit will<br>provide at least 70% or more knockdown of the target mRNA when used at 10 nM<br>concentration by quantitative RT-PCR when the TYE-563 fluorescent transfection control<br>duplex (cat# SR30002) indicates that >90% of the cells have been transfected and the HPRT<br>positive control (cat# SR30003) provides 90% knockdown efficiency.  |
|                            | For non-conforming siRNA, requests for replacement product must be made within ninety<br>(90) days from the date of delivery of the siRNA kit. To arrange for a free replacement with<br>newly designed duplexes, please contact Technical Services at techsupport@origene.com.<br>Please provide your data indicating the transfection efficiency and measurement of gene<br>expression knockdown compared to the scrambled siRNA control (quantitative RT-PCR data<br>required). |
