**Summary:** This gene encodes a member of the canonical subfamily of transient receptor potential cation

channels. The encoded protein forms a non-selective calcium-permeable cation channel that

is activated by Gq-coupled receptors and tyrosine kinases, and plays a role in multiple

processes including endothelial permeability, vasodilation, neurotransmitter release and cell

proliferation. Single nucleotide polymorphisms in this gene may be associated with

generalized epilepsy with photosensitivity. Alternatively spliced transcript variants encoding

multiple isoforms have been observed for this gene. [provided by RefSeq, Aug 2011]

## Performance Guaranteed:

OriGene guarantees that at least two of the three Dicer-Substrate duplexes in the kit will provide at least 70% or more knockdown of the target mRNA when used at 10 nM concentration by quantitative RT-PCR when the TYE-563 fluorescent transfection control duplex (cat# SR30002) indicates that >90% of the cells have been transfected and the HPRT positive control (cat# SR30003) provides 90% knockdown efficiency.

For non-conforming siRNA, requests for replacement product must be made within ninety (90) days from the date of delivery of the siRNA kit. To arrange for a free replacement with newly designed duplexes, please contact Technical Services at techsupport@origene.com. Please provide your data indicating the transfection efficiency and measurement of gene expression knockdown compared to the scrambled siRNA control (quantitative RT-PCR data required).
