Background: TRPM8 is a receptor-activated non-selective cation channel involved in detection of

sensations such as coolness, by being activated by cold temperature below 25 degrees Celsius. It is activated by icilin, eucalyptol, menthol, cold and modulation of intracellular pH

and involved in menthol sensation. It is permeable for monovalent cations sodium,

potassium, and cesium and divalent cation calcium.

Synonyms: LTRPC6; TRPP8

Formalin-fixed and paraffin-embedded human prostata carcinoma tissue reacted with TRPM8 antibody (C-term C940) (Cat.#[TA302224]), which was peroxidase-conjugated to the secondary antibody, followed by DAB staining. This data demonstrates the use of this antibody for immunohistochemistry; clinical relevance has not been evaluated.
