Gene Name:	adenosine A2b receptor
Database Link:	NP_000667 Entrez Gene 136 Human P29275
Background:	This gene encodes an adenosine receptor that is a member of the G protein-coupled receptor superfamily. This integral membrane protein stimulates adenylate cyclase activity in the presence of adenosine. This protein also interacts with netrin-1, which is involved in axon elongation. The gene is located near the Smith-Magenis syndrome region on chromosome 17. [provided by RefSeq]
Synonyms:	ADORA2
