Background: In T lymphocytes, the sole pathway for Ca⁺⁺ entry following antigen-receptor binding is through store-operated Ca⁺⁺-release-activated Ca⁺⁺ (CRAC) channels. These channels are made up of the pore-forming subunit ORAI1 and the stromal interaction molecule 1 (STIM1), a protein that functions as a Ca⁺⁺ sensor and activates the CRAC channels, migrating to the plasma membrane from endoplasmic reticulum (ER)-like sites which act as the Ca⁺⁺ store. A related molecule, STIM2, acts to inhibit the STIM1-mediated store-operated Ca⁺⁺ entry, and can form complexes with STIM1, suggesting they may play a coordinated role in controlling Ca⁺⁺ entry. At least three isoforms of STIM2 are known to exist. This STIM2 antibody is predicted to have no cross-reactivity to STIM1.
