Background:	The protein encoded by this gene is a member of the immunophilin protein family, which play a role in immunoregulation and basic cellular processes involving protein folding and trafficking. Unlike the other members of the family, this encoded protein does not seem to have PPlase/rotamase activity. It may have a role in neurons associated with memory function. [provided by RefSeq]
Synonyms:	FKBP38; FKBPr38
Note:	Seq homology of immunogen across species: Human (100%), Rhesus Monkey (100%)
Protein Families:	Druggable Genome, Transmembrane
