Synaptopodin 2 (SYNPO2) Rabbit Polyclonal Antibody - TA320130Background:SYNPO2 Antibody: SYNPO2 was initially identified as myopodin, a member of the
synaptopodin family that contains one PPXY motif and multiple PXXP motifs. It colocalizes
with alpha-actinin and is found at the Z-disc and during stress conditions will translocate to
the nucleus, suggesting that it is part of signaling pathways in addition to its function as a
structural protein. SYNPO2 has been shown to bind to calmodulin, alpha-actinin, and smooth
muscle myosin and will stimulate actin polymerization in a calmodulin dependent manner,
consistent with its proposed role in organizing the cytoskeleton. While deletion of SYNPO2
has been reported to be highly correlated with the invasiveness of prostate cancers, other
reports suggest that down-regulation of SYNPO2 reduces the invasiveness and motility of
prostate cancer cells.
