<b>Background:</b>	The protein encoded by this gene is involved in phototransduction. Along with another protein; the encoded protein forms a cGMP-gated cation channel in the plasma membrane; allowing depolarization of rod photoreceptors. This represents the last step in the phototransduction pathway. Defects in this gene are a cause of retinitis pigmentosa autosomal recessive (ARRP) disease. Two transcript variants encoding different isoforms have been found for this gene.
<b>Synonyms:</b>	CNCG; CNCG1; CNG-1; CNG1; RCNC1; RCNCa; RCNCalpha; RP49
<b>Protein Families:</b>	Druggable Genome, Ion Channels: Cyclic nucleotide gated, Transmembrane
