Background:	The protein encoded by this gene is a subunit of a pentameric inhibitory glycine receptor. The receptor mediates postsynaptic inhibition in the central nervous system. Defects in this gene are a cause of startle disease (STHE), also known as hereditary hyperekplexia or congenital stiff-person syndrome. Two transcript variants encoding different isoforms have been found for this gene.
Synonyms:	HKPX1; STHE
Protein Families:	Druggable Genome, Ion Channels: Cys-loop Receptors, Transmembrane
