Background:

This gene encodes transthyretin; one of the three prealbumins including alpha-1-antitrypsin; transthyretin and orosomucoid. Transthyretin is a carrier protein; it transports thyroid hormones in the plasma and cerebrospinal fluid; and also transports retinol (vitamin A) in the plasma. The protein consists of a tetramer of identical subunits. More than 80 different mutations in this gene have been reported; most mutations are related to amyloid deposition; affecting predominantly peripheral nerve and/or the heart; and a small portion of the gene mutations is non-amyloidogenic. The diseases caused by mutations include amyloidotic polyneuropathy; euthyroid hyperthyroxinaemia; amyloidotic vitreous opacities; cardiomyopathy; oculoleptomeningeal amyloidosis; meningocerebrovascular amyloidosis; carpal tunnel syndrome; etc.
