Background:	This gene catalyzes a two-step reaction that involves the transfer of the adenosyl moiety of ATP to methionine to form S-adenosylmethionine and triphosphosphate; which is subsequently cleaved to PPi and Pi. S-adenosylmethionine is the source of methyl groups for most biological methylations. The encoded protein is found as a homotetramer (MAT I) or a homodimer (MAT III) whereas a third form; MAT II (gamma); is encoded by the MAT2A gene. Mutations in this gene are associated with methionine adenosyltransferase deficiency.
Synonyms:	MAT; MATA1; SAMS; SAMS1
