**Background:** The protein encoded by this gene is a member of the transforming growth factor beta superfamily. Bone morphogenetic protein; also known as osteogenin; induces bone formation. It like other bone morphogenetic proteins (BMP's) is known for its ability to induce bone and cartilage development. It is a disulfide-linked homodimer. It negatively regulates bone density. BMP3 is an antagonist to other BMP's in the differentiation of osteogenic progenitors. It is highly expressed in fractured tissues.
