Background:	The protein encoded by this gene is required for the formation of O-acetylated (Ac) gangliosides. The encoded protein is predicted to contain 6 to 10 transmembrane domains; and a leucine zipper motif in transmembrane domain III. Defects in this gene have been reported to cause spastic paraplegia autosomal dominant type 42 (SPG42) in one Chinese family; but not in similar patients of European descent. Two transcript variants encoding the same protein have been found for this gene.
Synonyms:	ACATN; AT-1; AT1; CCHLND; SPG42
Protein Families:	Transmembrane
